

ABSTRACT

5 An isolated protein sequence or peptide from the E2, E6 or E7 early coding region
of human papillomavirus (HPV) that is soluble in an aqueous medium, and characterized by
a relative paucity of tryptophan, methionine and cysteine residues, and a relative abundance
of glycine and asparagine residues. Also disclosed are isolated protein sequences or peptides
from the E2, E6 or E7 early coding regions of HPV 16 and 18 and methodologies for
detecting or diagnosing cancer or cellular abnormalities. Detection or diagnosis of Cancer
or cellular abnormalities may include detecting or diagnosing pre-cancerous or pre-malignant
10 conditions, cervical dysplasia, cervical carcinoma, koilocytosis, hyperkeratosis,
intraepithelial lesions, and other cancers. A methodology for detecting or diagnosing cancer
or cellular abnormalities comprises the steps of (1) reacting a sample of body fluid or tissue
with isolated protein sequences or peptides; (2) forming an antibody-peptide complex; and
(3) detecting the antibody-peptide complex.
